

# Penthouse Dispatch Login Crash Debug Brief

Generated April 17, 2026

## Current Symptom

---

User can sometimes reach the sign-in screen, submit credentials, briefly sees `Account Still Loading`, and then the app goes to a black screen or never reaches the dashboard.

Earlier, some admin routes such as `/admin/companies`, `/admin/testing`, and `/admin/sentry` also rendered as black/blank pages.

## Desired Role Model

---

- `admin` = platform-wide owner
- `company` = company dispatcher/operations role
- `driver` = belongs to a company
- `rider` = rider-facing user

Legacy `dispatcher` should behave like `company`, not be a separate primary role.

## What Is Already Confirmed

---

- Supabase env values are present in deployed frontend bundles.
- Preview protection is no longer the blocker.
- Custom domains are still unreliable because DNS is not fully corrected, so testing should use exact deployment URLs.
- Backend migrations and Sentry diagnostics edge function were already applied/deployed earlier.
- Headless browser fetch of the deployment showed the sign-in page HTML rendering, so the app can load unauthenticated.

## Current Highest-Probability Failure Path

---

The authenticated boot path in `AppContext.jsx` is still fragile. The session appears valid, but the app can end up with no usable profile/role/company state quickly enough after sign-in. That leaves the app in the `MissingProfileScreen` / `Account Still Loading` path, and after that a downstream runtime issue may still be blanking the app.

## Important Files

---

- /Users/penthouse/Documents/New project/project/src/context/AppContext.jsx
- /Users/penthouse/Documents/New project/project/src/App.jsx
- /Users/penthouse/Documents/New project/project/src/pages/AuthPage.jsx
- /Users/penthouse/Documents/New project/project/src/lib/roles.js
- /Users/penthouse/Documents/New project/project/src/pages/admin/AdminDashboard.jsx
- /Users/penthouse/Documents/New project/project/src/pages/company/CompanyDashboard.jsx

## Recent Fixes Already Attempted

---

- 59ab128 Redirect protected routes to auth
- 261eb64 Harden post-login account routing
- 3b3ec10 Align roles around admin and company dispatch
- f79e3a7 Harden authenticated role routing
- ec2e048 Surface async runtime crashes after login
- 802c27e Timeout stuck Supabase session bootstrap
- c945c3f Stop blocking dashboard on account data load
- ecec2d7 Stabilize admin route loading
- af8d267 Remove alert widgets from dashboard boot path
- 5171744 Retry and backfill profiles after login
- 4f2abc0 Infer fallback account role from live data

## What The Code Currently Does

---

- normalizeAppRole() maps malformed roles and maps legacy dispatcher to company .
- Initial supabase.auth.getSession() is timeout-wrapped.
- Profile lookup now retries.
- If no profile is found, fallback profile creation tries to infer role from:
  - auth metadata role
  - companies.owner\_user\_id
  - companies.billing\_contact\_email
  - drivers.email
  - then falls back to admin
- Admin/company shells no longer lazy-load their critical route modules.
- Alert inbox and supervisor badge were removed from the critical dashboard boot path.

## Observed Browser/Deployment Behavior

---

Unauthenticated deployment fetch showed the login page HTML rendering normally.  
Authenticated user still reports: "Account Still Loading" for longer, then black screen.

## Best Next Debug Angles

---

1. Add explicit boot-stage logging/UI in `AppContext.jsx` so the app shows exactly which step it is in: session, profile, role, company, org, route mount.
2. Inspect browser console after successful sign-in to capture the first runtime exception.
3. Check whether the authenticated session user id matches the expected row in `profiles`.
4. Verify whether RLS or query errors on `companies` / `org_members` are throwing after profile resolution.
5. Temporarily bypass company/org hydration entirely after login and render a minimal dashboard shell to prove whether the crash is boot-state or page-component related.

## Useful Summary For Another Bot

---

The app is a React/Vite + Supabase multi-tenant NEMT platform.  
The big issue is post-login authenticated boot.  
Unauthenticated login page renders, but after login the user briefly sees "Account Still Loading" and then gets a black screen.  
Session is likely valid. Failure is probably in profile/role/company bootstrap or a runtime error immediately after that.  
Several hardening fixes are already applied, but the issue persists.  
Focus on AppContext boot sequencing, authenticated route mount, and the first runtime exception after login.
